KEY WORDS: Dive; Reward

Short Description & Main Mechanics

What genre of game are you going to make?

An isometric puzzle game divided in rooms where the player character will proceed through unlocking new skills that allows different types of environment manipulation in order to complete the later rooms.

Describe the camera, character and controls (3C's)

Isometric game with a 4 static cameras, one for each wall of the room.
The player character is a therapist that "dives" into people's minds, where he is faced with puzzle rooms; He can interact with the room as well as manipulate it, for example pushing/pulling objects, climbing the objects, pressing buttons, opening doors, etc.

The controls are:
WASD for walking around; Q and E to cycle through cameras; Spacebar for climbing objects; F to open doors; Left shift to spawn Scarecrow that can activate pressure plates, the player can also push/pull it; if the player presses it with an active scarecrow the player character and the scarecrow switch places destroying the scarecrow afterwards (Skill); R to Push/Pull objects (Skill); T to create a door (Skill);

What is the goal of the game? How do you beat the game? How can the player fail?

To beat the game the player must beat the final gauntlet of levels that he will only be able to use what he learned in previous levels. The goal of the game is to beat a set of 9 levels including the final gauntlet; each set of 3 rooms is a person's mind and solving them means helping people with their problems. The final gauntlet represents the player character's mind where he needs to use what he learned from his patients to deal with his own problems. There is no fail state per say, meaning a player failing simply means not beating the room and giving up. There will be, however, the possibility of restarting the level in case the player gets stuck somewhere.

Describe your main mechanics. Avoid the use of non-descriptive terms such as puzzles, magic, spells … Describe how the puzzle would work, what the spell does …

My main mechanics are:
Pushing and pulling marked objects scattered in each room, can be boxes, trampoline, stairs and furniture, the player cannot push or pull two objects at once;

- The player uses the boxes to press on pressure plates, to fill in the spaces of a broken bridge; the player can use the trampoline to give double the height as he was before jumping on it, it acts as a transitional "tile" so the player cannot stay in it after using it once; the player can use the stairs, allowing him to reach heights without needing to climb;

Climbing on top of marked environmental parts, the environment parts will have a color on the upper edge to communicate to the player that said object is possible to climb;

Creating doors in specific walls of the rooms with a proper outline or color, allowing the player to go through the wall. The player can only create one door at a time and once he creates another one the previous one fades away, becoming a wall again.

Spawning one scarecrow in the player's position. This scarecrow can be used as a moveable object, similar to boxes, to press pressure plates, when the player presses the button again instead of creating a new scarecrow it switches the player's position with the scarecrow's destroying the scarecrow and allowing the player to create a new one.

What is the focus of your project, which aspects of your game would you like to prototype? Which scope do you have in mind?

My focus is to create at least a set of 9 rooms with a puzzle each one, where the player can unlock and use these abilities. I would like to prototype the use of all the player abilities and different ways of using them to deal with different situations.
